"Poptide toxins from venomous Conus snails.";
Annu. Rev. Biochem. 57:665-700(1988).
-!- FUNCTION: Targets vasopressin-oxytocin related receptors.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Expressed by the venom duct.
-!- SIMILARITY: BELONGS TO THE VASOPRESSIN/OXYTOCIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score 11, DB 1, Length 9, pred. --- FUNCTION: TRANSALDOLASE IS IMPORTANT FOR THE BALANCE OF METABOLITES IN THE FRANSE-PHOSPHATE PATHWAY.

--- CATALYTIC ACTIVITY: Second-pptulose 7-phosphate + D-glyceraldehyde

3-phosphate = D-erythrose 4-phosphate + D-fructose 6-phosphate.

--- FATHWAY: Pentose phosphate pathway, nonoxidative part.

--- SIMILARITY: BELONGS TO THE TRANSALDOLASE FAMILY. SUBFAMILY 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Kataoka H.;

-!- FUNCTION: ACYL-PROTEIN SYNTHETAGE ACTIVATES TETRADECANOIC ACID.

IT IS A COMPONENT OF THE FATTY ACID REDUCTASE COMPLEX RESPONSIBLE FOR COMPURFING TETRADECANOIC ACID. TO THE ALDERYDE MHICH SERVES AS SUBSTRATE IN THE LUCTERRASE-CAMPLYZED REACTION.

-!- CATALYTIC ACTIVITY: ATP + an acid + protein = AMP + diphosphate +

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A Geneseq 19Jun01:*

                                                                                                                                                                                     antigen HA-1 R-allele. The specification describes methods for typing alleles (preferably the H and R alleles) of the minor histocompatibility antigen HA-1 in a sample, which comprise detecting polymorphic nucleotides in the cDNA or genomic nucleic acids of the alleles. The methods can be used for HA-1 typing for bone marrow transplants, severe aplastic anaemia, leukaemia and immune deficiency diseases, as well as detection of genetic aberrances. The probes and primers of the invention can be used to screen for the HA-1 alleles. The HA-1 peptides can be used anti-idiotypic B cells and/or T cells and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a new peptide (F1) constituting a T-ceil epitope cheainable from the minor histocompatibility antigen HA-1. The peptide is immunogenic and can be used as part of a vaccine. Pi is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Minor histocompatibility antigen; HA-1; T-cell epitope; immunological; graft versus host disease; bone marrow transplant; leukaemia; vaccine; diagnosis; aplastic anaemia; immune deficiency disease.
                                                                                                                                                                 present sequence represents part of the minor histocompatibility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A new minor histocompatibility antigen, HA-i - useful to treat immune diseases and prevent rejection and host versus graft disease in bone marrow and organ transplantation
Typing minor histocompatibility antigen HA-1 - by amplifying and identifying HA-1 R and HA-1 H alleles of HA-1, used for, e.g. detection of genetic aberrances
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     100.0%; Score 42; DB 20; Length 9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents part of the minor histocompatibility antigen HA-1 H-allele. The specification describes methods for typing alleles (preferably the H and R alleles) of the minor histocompatibility antigen HA-1 in a sample, which comprise detecting polymorphic nucleotides in the CDNA or genomic nucleic acids of the alleles. The methods can be used for HA-1 typing for bone marrow transplants, severe apparatic anaemia, leukaemia and immune deficiency diseases, as well as detection of genetic aberrances. The probes and primers of the invention can be used to screen for the HA-1 alleles. The HA-1 peptides can be used anti-idiotypic B cells and/or T cells and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                The present sequence represents a new peptide (P1) constituting a T-cell epitode obtainable from the minor histocompatibility antigen HP-1. The peptide is immunogenic and can be used as part of a vaccine. Pi is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to read (auto) immune diseases. In particular it can be used with home marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency
                                                                          Minor histocompatibility antigen; HA-1; T-cell epitope; immunological; graft versus host disease; bone marrow transplant; leukaemia; vaccine; diagnosis; aplastic anaemia; immune deficiency disease.

The present sequence represents an immunogenic peptide constituting a T-cell epicope, obtainable from the minor histocompatibility antigen HA.: The peptide can be used in vaccines or pharmaceutical formulations as medicines to induce telerance for transplants so as to prevent rejection and/or Graft-versus-Host Disease, or to treat autoimmune diseases. Neoplastic hearmatopoietic cells presenting the peptides, in an HLA class I context, can be eliminated after specific recognition of the peptides. The peptides can also be used to raise antibodies, T-cell receptor, 5- and T-cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Minor histocompatibility antigen; HA-1; T-cell epitope; immunological; graft versus host disease; bone marrow transplant; leukaemia; vaccine; diagnosis; aplastic anaemia; immune deficiency disease.

Sequences AAUT1093-AAUT1796 represent the 1039328-related protein and peptide fragments of the protein. 1039328 exhibits tissue specific many cancers softthe protein. 1039328 exhibits tissue specific many cancers including tumburs of the prostate, bladder, kidrey, colon, lung, breast, rectum and stomach. The 1039328 polynucleotide, its related useful for diagnosing and stomach. The 1039328 polynucleotide, its related polynucleotide which encodes a single chain monoclonal antibody, that chaminospecifically binds to an 1039288-telated protein, and a ribozyme capable of cleaving a polynucleotide having the 1039328 coding sequence, are both useful in the preparation of a composition for treating a patient which a cancer that expresses 1039286. The sequences can be used in diagnostic methods to monitor the level of 103928 gene products in serum, blood, urine and tissue and to thereby detect the presence of

                                                                                                                                                                                                                                                                                                                                                                                                                                             0
                                                                                                                                                                                       The present sequence represents a new peptide (PI) constituting a T-ceil epitope obtainable from the minor histocomparibility antigen HA-1. The peptide is immunogenic and can be used as part of a vaccine. Pi is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency

The present sequence is a randomised DNA-binding domain on the alpha-helix of a zinc finger of the transcription factor Zif269. It was alpha-helix of a zinc finger of the transcription factor Zif269. It was careful an example to illustrate an invention relating to a library of DNA sequences immobilised on a solid substrate, comprising 40 of possible permutations of a DNA sequence has one of the 4N of possible permutations of a DNA sequence of length N. The library is useful for designing a zinc finger polypeptide having specificity for a particular DNA sequence. Typically a zinc finger motif is designed. The produced by recombinant or synthetic methods and ontacted with an immobilised DNA library. Binding is detected and the specificity and affinity of the zinc finger protein may be modified to increase in the specificity and affinity. The library is also useful for determining the preferred base recognition specificity of zinc finger proteins. The designed zinc finger proteins are useful for therapy, e.g. the greating mutations in targeting double stranded DNA, for diagnosis, e.g. detecting mutations in
                                                                                                                                                                                 Human immunodeficiency virus type 1; HIV-1; zinc finger protein; 2if268; DNA library; DNA chip; DNA binding domain; therapy; mutation detection; DNA purification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Library of DNA sequences immobilized on a solid support for selecting and designing polypeptides, comprising nucleic acid binding motifs, in particular zinc finger polypeptides.
                                                                                                                                                 Zif268 zinc finger alpha-helix randomised DNA-binding domain #10.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 24, DB 22; Length 7; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequences AAU71093-AAU71796 represent the 103P3E8-related protein and peptide fragments of the protein. 103P3E8 exhibits tissue specific expression in normal adult tissue, but it is also aberrantly expressed in many cancers including tumours of the prostate, bladder, kidney, colon, lung, breast, rectum and stomach. The 103P3E8 polynuclectide, its related protein and peptide fragments and specific PCR primers are therefore useful. for diagnosing and treating cancer. A vector comprising a manuscapecifically binds to an 103P3E8 related protein, and a ribozyme capable of cleaving a polynuclectide having the 103P3E8 coding sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 103P3E8. The sequences can be mindiagnostic methods to monitor the level of 103P3E8 gane products in diagnostic methods to monitor the level of 103P3E8 gane products in Serum, blood, urine and tissue and to thereby detect the presence of
                                                                                                                                 stomach;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0.5

The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABX01789-ABR01861). The genes and proteins are useful for alloiting a humoral or callular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, manAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as rools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic prognostic and diagnostic reagents for cancer. The present sequence is a numan leukocyte antigen (MLA) peptide, used in an example from the invention.
                                                                                                                                                                                                                                                             New composition comprising a substance that modulates the structure of
proteins and polynuclectides, useful for therapeutic, prognostic and
diagnostic reagents for eliciting cellular or humoral immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Hubert RS;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to novel human cancer-related genes and proteins (AB27012C-AB273166 and ABR01789-ABR01661). The genes and proteins are useful for eliciting a humanal or cellular immune response. The genes are useful for promose and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the adjagnosis and/or prognosis of cancer, as coding sequence capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic and aliagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

cancer patients

```
The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78160 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or caltular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proceins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present
The present invention relates to novel human cancer-related genes and proteins (ABZ70120-ABZ70168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humaneal or cellular immune response. The genes are useful as probes and primers for the amplification and/or diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or hunoral immune response

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                            The present invention relates to novel human cancer-related genes and proteins (AB278120-AB278168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humonal or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the adjaponsis and/or prognosis of canner, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic and diagnostic regents for cancer. The prosest therapeutic and diagnostic regents for cancer. The prosest sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response
                                                                         New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response

Sequence 20, Application US/08399411

Patent No. 5831008

GENERAL INFORMATION:
APPLICANT: Huang, Shi
ITLE OF INVENTION: Relinchlastoma Protein - Interacting
ITLE OF INVENTION: Zinc Finger Proteins
NUMBER OF SEQUENCES: 93
CORRESPONDENCE ADDRESS:
ADDRESSEE: Campbell and Flores
STREET: 4370 is Jolla Village Drive, Suite 700
CITY: San Diego
STATE: California

Patent No. 581038
GENERAL INFORMATION:
APPLICANT: Huang, Shi
TTLE OF INVENTION: Retinoblastoma Protein - Interacting
TTLE OF INVENTION: Zinc Finger Proteins
TTLE OF INVENTION: Zinc Finger Proteins
TTLE OF INVENTION: 2 93
TTLE OF INVENTION: Zinc Finger Proteins
TTLE OF INVENTION: 201
TTLE OF INVENTION: 201
TTLE OF INVENTION: 201
STREET: 4370 La Jolia Village Drive, Suite 700
CULTIE: California
COUNTRY: USA
APPLICANT: Huang, Shi
TITLE OF INVENTION: Retinoblastoma Frotein - Interacting
TITLE OF INVENTION: 2 inc Finger Proteins
NUMBER OF SEQUENCES: 93
CORRESPONDENCE ADDRESS:
ADRESSED Campbell and Flores
STREET: 4370 La Johla Village Drive, Suite 700
CITY: San Diego
STATE: California
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 50.0%; Score 21; DB 2; Length 8; 80.0%; Pred. -- FUNCTION: TRANSALDOLASE IS IMPORTANT FOR THE BALANCE OF
METASOLITES IN THE PENTOSS-PHOSPHATE PATHWAY.
-- CATALYTIC ACTIVITY: Sedcheptulose 7-phosphate + D-glyceraldehyde
3-phosphate = D-eryticose 4-phosphate + D-fructose 6-phosphate.
-- PATHWAY: Pentose phosphate pathway; nonoxidative part.
-- SIMILARITY: BELONGS TO THE TRANSALDOLASE FAMILY. SUBFAMILY 1.
                                                                                                                                                                                                                                              01-AUG-1990 (Rel. 15, Created)
